The cholesterol content of the liver is derived predominantly from three sources.

The liver can synthesize cholesterol, take up cholesterol from the blood from circulating lipoproteins, or take up cholesterol generic Zetia No Rx by the small intestine. Intestinal cholesterol is derived primarily from cholesterol secreted in the bile and from dietary cholesterol. Ezetimibe has a mechanism of action that differs from those of other classes of cholesterol-reducing compounds statins, bile acid sequestrants fibric acid derivatives, and plant stanols.

The molecular target of ezetimibe has been shown to be the sterol transporter, Niemann-Pick C1-Like 1 NPC1L1, which is involved in the intestinal uptake of cholesterol and phytosterols. Ezetimibe does not inhibit cholesterol synthesis in the liver, or increase bile acid excretion.

This causes a reduction of hepatic cholesterol stores and an increase in clearance of cholesterol from the blood; this generic Zetia No Rx mechanism is complementary to that of statins and of fenofibrate. In addition, decreased levels of HDL -C are associated with the development of atherosclerosis. Epidemiologic studies have established that cardiovascular morbidity and mortality vary directly with the level of total-C and LDL-C and inversely with the level of HDL-C.
